

DocuWare is a proven enterprise content management system. Paired with the StapleWare® Release of Information Manager module, it makes encapsulating and encrypting medical records safe and easy.

Authority to Request Records

The Release of Information module will allow a Medical Records staff member to access the records, verify the patient name and medical record number and verify that the person that is requesting the records has the authority to request the records.

Dynamically Collect all Patient Records

All Archived records are available electronically if the patient should request a copy of the records. Once the medical record is selected, the staff person has the option of selecting one or more visits from a dropdown list. The records can then be exported to a network folder or to a portable USB drive. The records can be encrypted if the patient requests that they be encrypted.

For example: The Affordable Care Act stipulates that each patient has the right to request access to their own medical record. This has been a cumbersome and time consuming process until now. The ROI Manager presents the entire medical record and provides a choice to the patient as to which records they would like to take with them and which media would suit their needs.

Benefits

- Positively Identify Patients
- Select Records to be Released
- Encryption of Medical Records
- Export to Folder or USB Drive
- Electronic Signature Required
- DocuWare Cloud Compatible

Applications

- Release of Medical Records
